Pitch deck, November 2026

A friendly assistant that remembers your life

Debo keeps your journal, voice notes and plans, and answers questions about your own life by text or voice. Every answer shows the entry it came from. You can see, fix and delete everything it knows.

Live today as an early version at my.debo.life. Built by one founder. Raising to pay for the AI that each person uses, and to open Debo up carefully.

Try the app Use cases

1. Problem

Your life is spread across a dozen places, and the AI you ask does not really know you

This is the founder's view of the problem. We have not run a survey, so we do not quote a statistic here.

You cannot find your own past

What the doctor said in March, when you last spoke to a friend, what you promised your mother. It is in chats, notes, photos and your head.

General assistants forget, or guess

A chat assistant may remember a few facts, but it often cannot show where a fact came from. You cannot tell a memory from a made-up answer.

Personal data is a big thing to hand over

A tool that holds your diary and voice must be clear about where it goes, and let you fix and delete it. Most do not make that easy to see.

2. Insight

For something this personal, trust is the product

People will only keep their life in one place if they can check it. So every answer carries its source, and nothing is hidden.

No source, no answer

Debo answers only from what the person wrote or said, shows a chip for each entry it used, and says "I don't have anything about that yet" when it has nothing.

Glass box, not black box

A page lists every memory with its source. The person can fix or forget each one, and a record shows what Debo read and did.

Speak the way you speak

Many people in India mix Hindi and English in one sentence. Debo's voice is built on speech models that handle English, Hindi and a mix. How well they do on real Hinglish is not yet tested.

3. Solution

One assistant that keeps your life and can act on it, with your yes

Built

Journal and recordings

Built

Ask about your life

Built, partly tested

Talk to Debo

Write entries, or record a voice note or video. The words are written out and kept as an entry. Recordings are built and tested with stand-ins; a first real-world check is still to do.

Ask in plain words, by text. Answers show their source chips.

Speak in English, Hindi or a mix and hear the answer. Tested in the web app with a fake microphone; not yet on a real phone.

Built

What Debo knows

Every memory, with its source. Fix it or forget it.

Built, needs live tests

Connected apps and a browser

Through Composio, Debo can read from apps such as Gmail. Anything that sends, posts or changes waits for a yes on screen. Voice can never give that yes. Debo can also browse the public web.

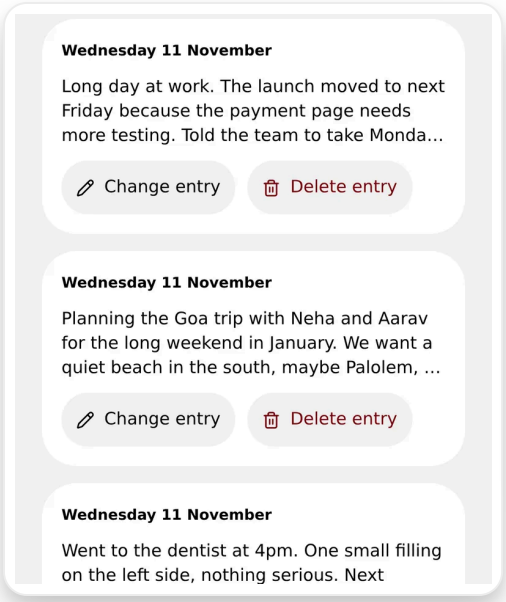

Planned

Companion and role-play

A warmer, more playful character for people who want a friend, with firm safety rules. Today Debo has an editable name and tone, and a mascot with moods. The companion mode itself is not built.

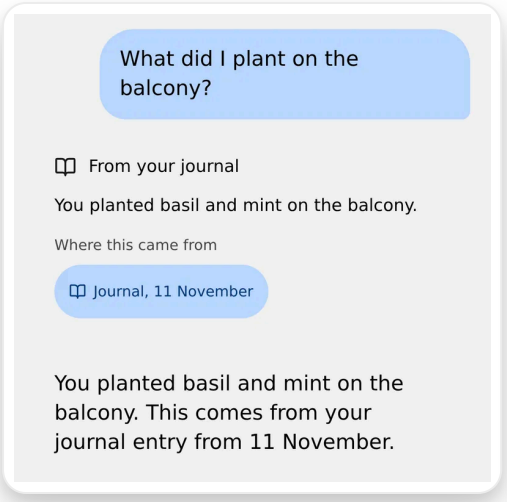

What it looks like today

Real screenshots of the app at my.debo.life, with made-up demo entries.

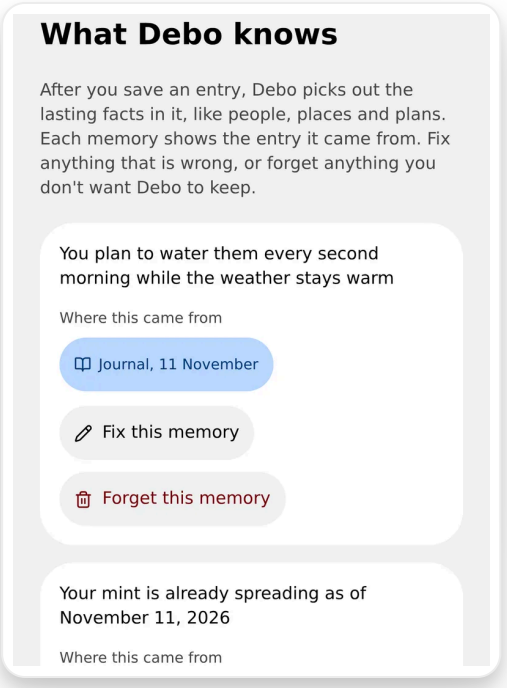

Journal

Write or record. Edit and delete any entry.

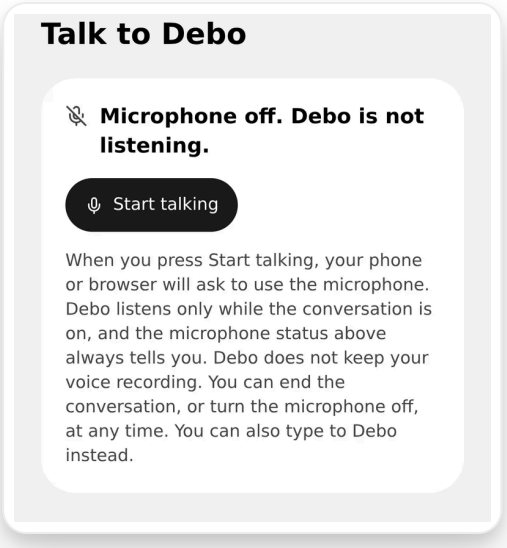

Ask

Answers with a chip for every source.

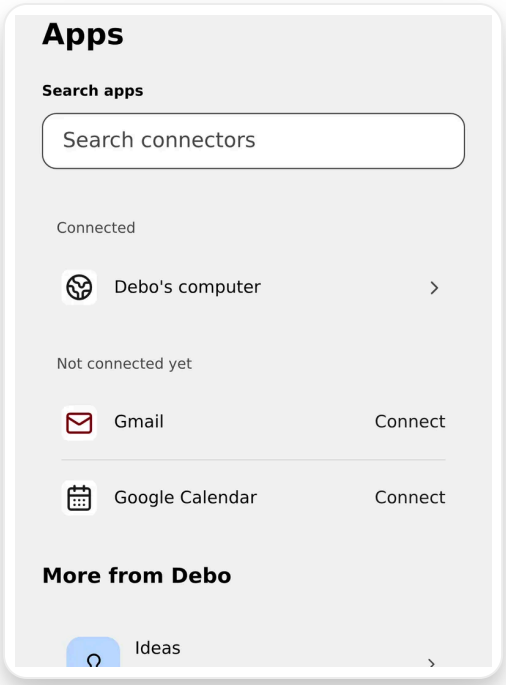

What Debo knows

Talk

Speak, with a clear microphone light.

Every memory, with fix and forget.

Apps

Connect apps one at a time.

5. Demo

Watch it, then try it yourself

Demo video

The demo video is being recorded. Ask us for a walkthrough, or try the app yourself on the Try it page.

Open the app

6. Why now

The AI got cheap, India went online in its own languages, and the

old memory gadgets are fading

AI cost fell by a factor of ten

Claude Haiku 5.5 lists at $0.10 input and $0.50 output per million tokens. Haiku 4.5 lists at $1 and $5. That is what makes a daily question on a small budget possible.

Anthropic pricing, 14 Nov 2026

India is online, in its own languages

886 million active internet users in 2024, 98% of them reading content in Indian languages; a later report puts the number above 950 million.

IAMAI-Kantar via BestMediaInfo, Business Today, Jan 2026

Talking to an AI is now a habit

OpenAI says India has about 100 million weekly ChatGPT users, and its India head has said India is now its largest market. Both are company statements reported by the press. TechRepublic, Inc42

Standalone memory gadgets are consolidating

Meta bought Limitless (formerly Rewind) in December 2025 and stopped selling its pendant to new customers. The need is real; the independent apps struggled. Neowin

7. Market

A bottom-up view: start with people who already use an AI assistant weekly

We start with the 100 million weekly ChatGPT users in India (a sourced floor for people who use an AI assistant) and apply a share who would keep a personal memory assistant. The share and the price are our assumptions, set out and adjustable on the market page.

See the sizing, with sources

8. Business model

Free by invitation, then a monthly plan that covers what each person's AI costs

Prices are a proposal and are not decided. The point of the model is that every tier is priced above its own cost at its own limits. The numbers are on the unit economics page.

Proposal

Invited, free

Small caps. Text and voice notes only. No voice calls or browser.

Proposal

Founding, $6 a month

First paid cohort with voice minutes and some browser time.

Proposal

Plus, $15 a month

More voice, browser and connected apps, with fair limits.

Unit economics and formulas

9. Go to market

No free mass launch. Invite people in small groups, and let funding set the pace

AI costs real money for every active person, so we grow as fast as we can pay for it: a waitlist, hard daily limits, a small paid founding group, then wider after funding.

Read the plan

10. Competition

Big assistants add memory; companion apps add warmth; journals add safety. Few show their sources

A fair, sourced comparison is on the market page. Our position is a combination, not a feature nobody else could copy.

See the comparison

11. Moat

What we are building to be hard to copy

Honest note: these are early positions, not locked-in advantages. A large company could copy a feature. What is slow to copy is a pile of one person's trusted history and a product built around trust from the start.

Personal memory with sources

The longer someone uses Debo, the more it knows about them, and every fact points to its original. Leaving means leaving that record behind (though they can download it).

Trust and data control

See, fix, download and delete everything, a public privacy page that admits what is still unchecked, and no ads or selling of data. This is a brand promise that is hard to add late.

Voice in Hindi, English and Hinglish

A voice path built for mixed speech from day one, on providers that handle it. Quality on real speech is still to be measured.

Approvals before actions

Anything that sends, posts, pays or deletes needs a yes on screen, and voice can never give it. This makes it safe to let Debo do more.

12. Traction

What is true today, and nothing more

We have not opened Debo to the public. We do not claim users, revenue or testimonials, because there are none to claim.

The product is live

The early version runs at my.debo.life, with sign-in.

Built by one founder

Shaswat Raj wrote the whole codebase on his own.

Features shipped

Journal, answers with sources, memories you can fix and forget, activity record, export and delete, voice notes and videos, talking by voice, connected apps with approvals, a browser. Some of these are built and tested with stand-ins and still need a first test against the real services. See the diligence page.

To be added by the founder **Traction numbers, if any: waitlist size, pilot users, retention. Do not add numbers that are not measured**

13. Roadmap

What comes next, in order

From the repository's own roadmap and notes. None of this is promised to a date.

Next

Now: make it safe to invite people

Confirm which Mem0 plan Debo is on, and that it does not train on entries. Check the voice providers' data terms. Run recordings against the real storage and speech services. Measure real cost per person.

Next

Then: charge fairly

Plans and payments through a hosted checkout, monthly limits shown to the person, a founding paid cohort.

Planned

Then: the phone

Recording and speaking inside the phone app, tested on real devices. Hindi and mixed-speech quality tests.

Planned

Later: companion mode and more

A companion character with safety rules, quick capture from messaging apps, use Debo's memory from other

AI tools, on-this-day and weekly look-backs.

14. Team

One founder

Shaswat Raj, founder

Sole author of the Debo codebase.

To be added by the founder **Founder bio and background**

To be added by the founder **Advisors, early hires or co-founders, if any**

15. The ask and use of funds

Fund the AI behind each person, and open Debo up carefully

Because AI costs grow with every active person, money is what lets us invite people at all. These are the things funding pays for, in the order we would spend it.

To be added by the founder **Amount being raised**

To be added by the founder **Valuation or cap, and the instrument (for example SAFE)**

To be added by the founder **Percent split of the use of funds across the lines below**

AI and voice usage

The monthly bill for model, voice, speech and browser time for invited and paying people, within the daily and monthly limits on the unit economics page.

Safety and trust work

Checking each provider's data terms, a proper privacy policy reviewed by someone qualified, a security review, and the companion safety rules.

Phone app and voice quality

Real-device testing, in-app recording and speaking, and measured Hindi and Hinglish quality.

This page is for investors and is not listed in search engines. Debo is an early version, built by one founder. Numbers marked as estimates are estimates. Every outside number has its source beside it.
